Assessment Strategies for Canada’s Historic Sites

Linda Dicaire Fardin

Planning for treatment can be reactive—born out of a crisis—or it can be strategic—developed with the understanding that the short and long term care of historic fabric, on recognition, on the willingness to protect, on timely and appropriate intervention, and not least of all on the availability of resources, human, financial or otherwise. Generally speaking, strategic planning should result in an accepted definition of long-term objectives so that daily decisions build upon one another and are compatible with the aims set for the site. Whether expressed in a report, developed in a formal master plan, or simply understood by owner, managers, designers, maintenance staff and others involved, it is critical that an understanding of the make-up of the heritage character of the site and of long-term objectives be shared between all who influence site conservation and development.

Strategic planning depends to some degree on processes of a macro scale whereby landscapes of similar types are compared in order to assess their degree of significance. The Canadian Historic Sites and Monuments Boards, for example, evaluates the national historic significance of historic landscapes. The English Register of Historic Parks and Gardens also places in three ascending categories of importance parks, gardens and landscapes. Criteria associated with historical and aesthetic importance have traditionally influenced the assessments of designed landscapes; however, there is a growing movement toward examining their value(s) from a broader cultural perspective. In hand with this phenomenon is an increase of awareness of other types of cultural landscapes such as those which result from gradual evolutionary processes—settlement, for example—and such as those who have associative values by virtue of the powerful religious, artistic or cultural associations of the natural element. In these cases historical and aesthetic criteria may have a lesser or different influence in the overall assessment of cultural value.

Macro evaluation helps to identify sites of greater significance, and to rank those of lesser significance accordingly; ultimately, it provides the means to recognition and a tool for the decision-making process associated with the allocation of resources. In principle, sites of the greatest significance should become the objects of greater recognition and of the most rigorous protection and care. In practice, this is unfortunately not always the case.

In the name of progress, of necessity, of evolution and sometimes in the name of art, a number of historic landscapes are forced into submission—forced out of a hundred or more years of continuity, into unjustified, disconnected change. This phenomenon is particularly damaging when it occurs in association with landscapes that have a very high cultural value or which possess some unique character.

Pressures of change constantly challenge historic landscapes to justify their importance and their level of protection. Given the momentum in growth of public concern for environmental quality and sustainable development, we can hope that it is only a question of time before the onus is placed on change to demonstrate its necessity.

The thinking about historic landscapes has already dramatically increased in sophistication in recent years; however, in some ways it remains archaic. Today, anyone dreaming of threatening the beautiful neo-gothic elevation of the east block of Parliament Hill with a picture window would soon meet with ardent criticism but so-called landscape “improvements” are carried out without much remonstrance. This happens because there is a lack of appreciation of the short- and long-term consequences of seemingly innocuous interventions of the heritage character and authentic fabrics of a historic landscape. Lawns illustrate this well as they seem to be particularly vulnerable to the inclinations of those who cannot look at a piece of lawn without wanting to put something in it—statues, sculptures, fountains and flower gardens being favourite offenders. Macro-evaluation may be a useful mechanism to identify and compare significant historic landscapes, but it has limited application thereafter as far as site specific conservation strategies are concerned. Clearly other tools are required to make site-specific decisions in an informed and thoughtful manner. It is one thing to recognize that a landscape is historically or culturally important; it is quite another to identify what is important about it, what is the tangible evidence that
Part II: Planning for Treatment

- Specific recommendations addressing the quality of each distinct zone from a historic, aesthetic and functional perspective.
- Specific recommendations addressing the visual and functional relationships between spaces.
- Specific recommendations addressing the quality of hard and soft fabrics from a historic, artistic and functional perspective.
- Specific indications of the high, medium and low priorities including the need for additional studies, and of the urgency of the prescribed conservation treatments.
- General cost estimates of the human and financial resources associated with the carrying out recommendations.

Assessments and recommendations should at all times be directed by the knowledge of historical design and artistic intent(s).

To be useful, the results of the comprehensive study described above need to be synthesized into a management plan and/or master plan where agreed upon recommendations are translated into short- and long-term objectives that are clearly outlined. The master plan should then be ratified and distributed by the approving authority in order to ensure that it provides direction to all parties concerned in future deliberations and interventions. Periodic reviews and discussions are then useful to address new requirements, and lacunae and misunderstandings in the interpretation of prescribed treatments including routine maintenance.

It is good to remind ourselves that planning for treatment is not an end in itself but a means by which informed decisions can be reached. Conservation plans for historic landscapes have sometimes been wrongly upheld as mechanisms to freeze landscapes, which is, in any event, a ludicrous concept since landscapes by their very nature are in a constant state of change. A plan for treatment should always focus on the ideas which these designed landscapes express, and where sufficiently significant, these ideas should be understood, respected, interpreted and re-expressed. Ideas, contentious or not, are, after all, eternal and in the end are perhaps the only reality.\textsuperscript{5} Taken in the proper context, planning for treatment provides a mechanism to guide appropriate and timely cyclical renewal. However, in the final analysis, a plan for treatment is only as successful as it is understood and the will to implement it is strong.

The recent proposal to introduce an elaborate contemporary rose garden in the classified grounds of Rideau Hall, a Canadian national historic site, has not been without controversy (figure 1). It provides a useful example to examine some of the thorny issues associated with the integration of new proposals into authentic historic grounds. The new intervention consists of paved footpaths, a water feature, sculptural elements and rose beds placed at arm’s length of (not to say within) the well preserved picturesque wooded entrance park and open parkland.

The location of the new rose garden within the grounds has been contentious because the site enjoys five distinct historic zones, four of which are in a good state

\textsuperscript{(Canada—continued on page 16)
of repair from a historical and conservation perspective. In a nutshell, the areas are the wooded entrance park (figure 2), the open parkland, the sugar bush, the ornamental flower gardens, and the former farmland/administrative area, the latter being in the least satisfactory condition. Of these areas the wooded entrance park has been planted and groomed consistently for 130 years as an English picturesque wooded park characterized principally by graceful trees, lawn and elegant drives.

On one hand, it has been held by the proponents of the intervention that it is sensitive and adds a new layer to the site and will provide enjoyment. On the other hand, it has been advocated that this new layer is inappropriate from a conservation perspective principally because of the selected location. That opinion is substantiated by the following reasoning:

- The heritage character of the wooded entrance park is defined by a simple elegance; the ornamental characteristic of a rose garden will upset the heritage character of the wooded entrance park by introducing elements which are a clear departure from the simple elegance of trees and lawn.
- Another area of the site, namely the ornamental flower gardens, already serves an ornamental voca-

...tion ideal for a rose garden; furthermore, the ornamental flower gardens have been transformed on numerous occasions, and would benefit from stronger definition. Were this project to be implemented in this area, it would provide a welcome opportunity to strengthen the character of the flower gardens, and introduce a welcome legacy.

- The character nor the fabric of the wooded entrance park is accidental; it is the result of the deliberate and consistent application of design intent as revealed by historical research going back to 1865 when Lord Monck requested that 400 trees be planted in front of Rideau Hall, to 1867 when another 195 trees were introduced, to 1900 when Lork Minto directed a number of improvements namely thinning and trimming, to 1905 when Lady Grey embellished the wooded entrance park with a naturalized planting of bulbs, and so on.

- In the broader context, surviving authentic English picturesque estates of such integrity are few in Canada and, therefore, their intrinsic qualities should be preserved for the edification and enjoyment of present and future generations.

Situations like the ones at Rideau Hall give considerable cause for thought. Years ago Catherine Howett, in a study of reconstruction and conservation intervention suggested that none would ever dream of putting the arms back on the Venus of Melos, and so questioned to a degree the merit of reconstructions in the context of historic gardens. That analogy is extremely useful in the context of this discussion. Taken from another perspective, why would anyone modify the drapes of her robe when they are so exquisitely carved? Yet, with historic gardens this happens frequently.

And so the pendulum swings back and forth between the restorer who wants to take the historic landscape back in time and the modernist who wants to give it a new face. Indeed there are cases where either of those approaches may be appropriate. In the case of the designed landscapes which have somehow miraculously come to us in good condition, should we not think hard and twice before interrupting the continuity of the time scale.

Linda Dicaire Fardin is the supervising conservation landscape architect, Heritage Conservation Program, Architecture and Engineering Services, Public Works Canada, Environment Canada-Canadian Parks Service.
